

# Python Workshop Setup Guide

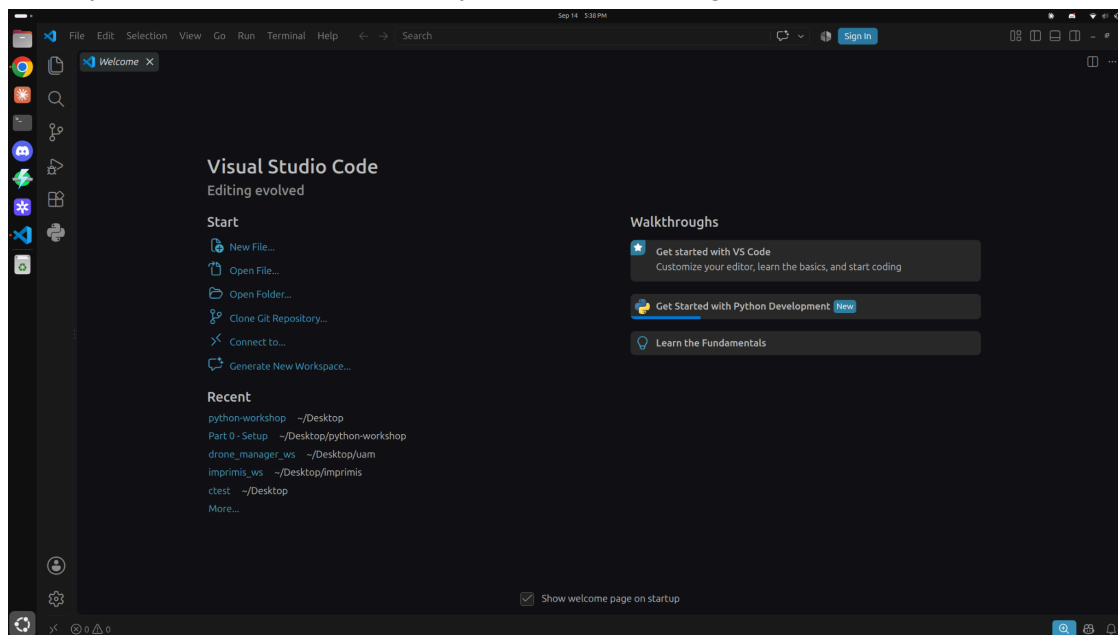

VS Code is the primary code editor we will use for this workshop. From here, you can create new python files, edit existing python files, and run code directly. You can also view PDF files in the editor alongside code.

## Installing VS Code

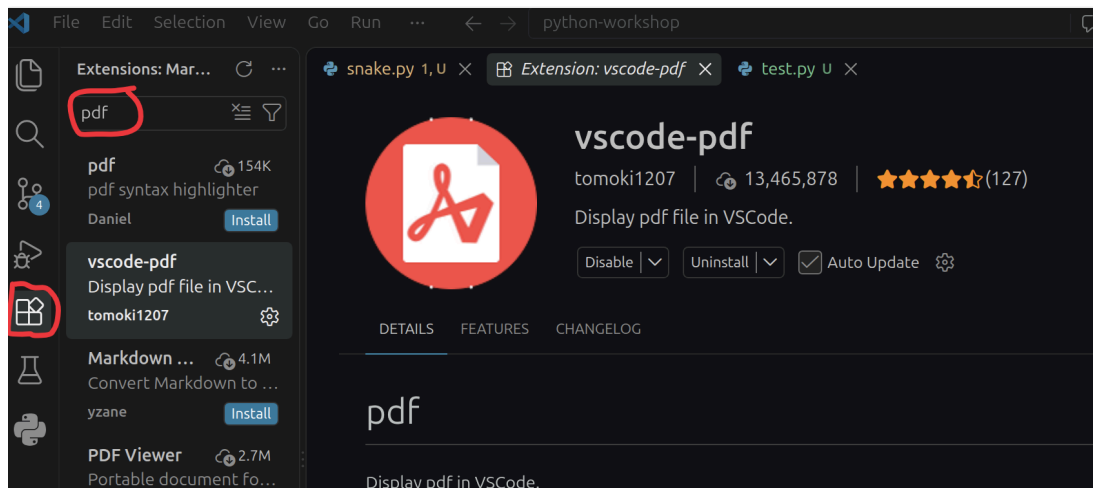

Use the following link to install VS Code: <https://code.visualstudio.com/download>  
It works on Mac, Windows, and Linux.

## Installing VS Code extensions

When you open it for the first time, you'll see something like this:

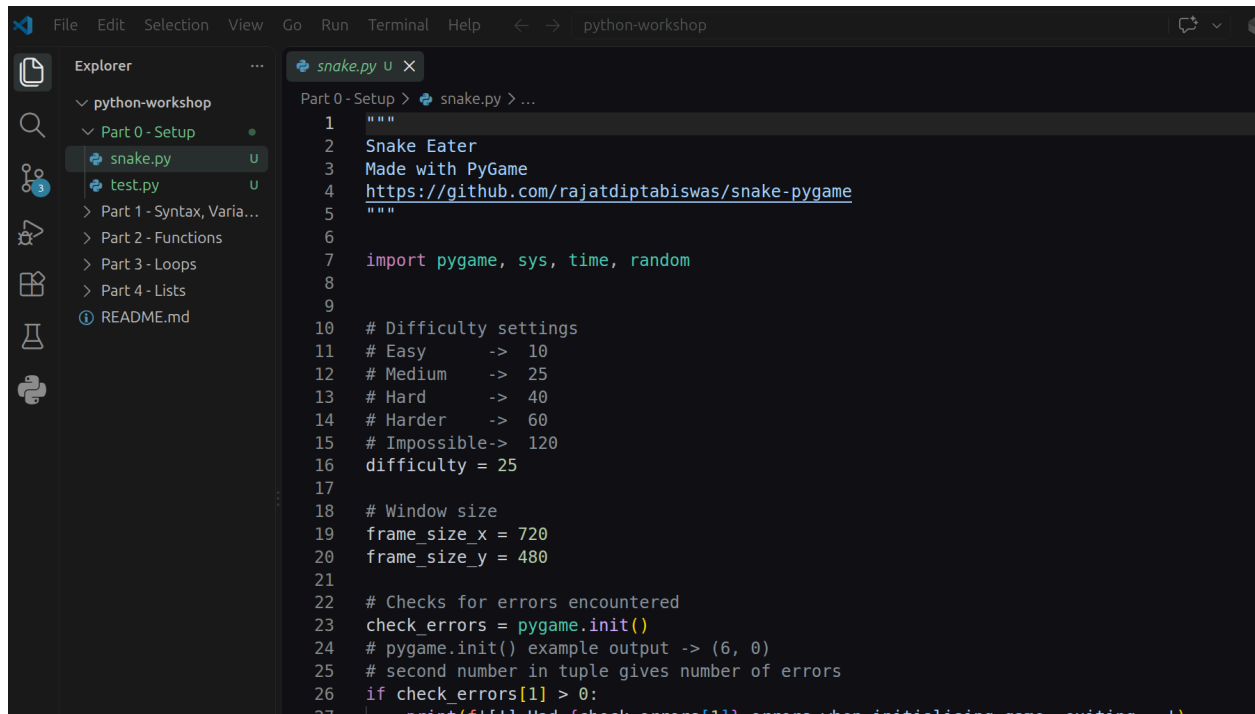

You'll need to download the python extension to make it work with python. You should also download the PDF viewer extension for convenience.

## Opening the workshop folder and viewing code

After you've got the extensions installed, you can open the "python-workshop" folder you downloaded by using file -> open folder in the top bar. After you do that, you'll see something like this. The files will not match exactly, that is OK.

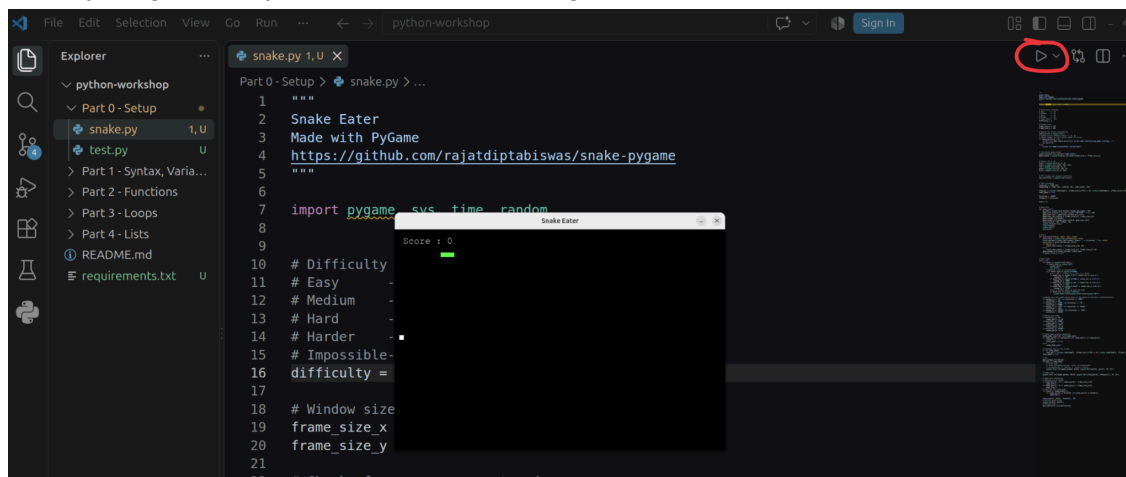

On the left, you can see all the sub-folders that contain the different lessons. Within them, you'll see python code files (ending in .py) and PDFs. You can open files simply by clicking on them.

Don't worry about the colors of the file names - it doesn't affect anything in the workshop. VS Code should automatically reopen the folder for you whenever it starts up, but you can always reopen it yourself (file -> open folder -> wherever you put python-workshop)

## Running programs

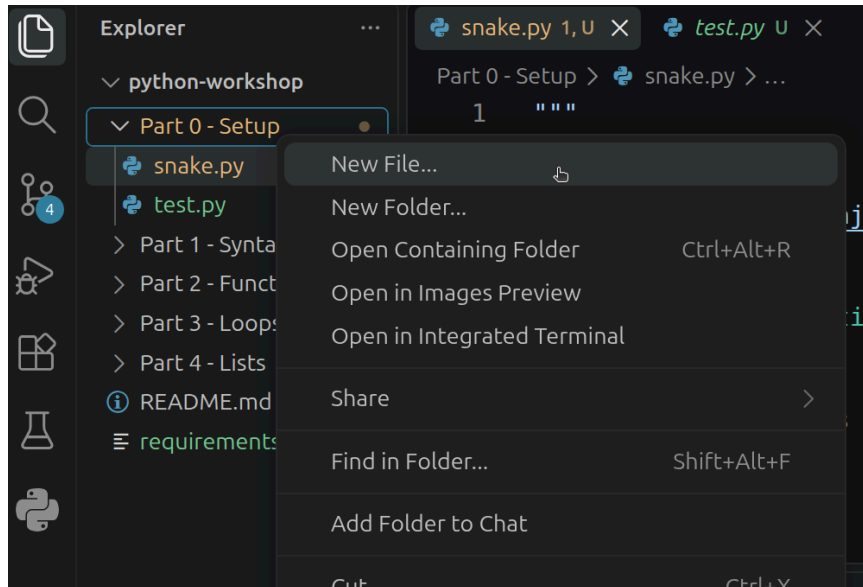

the “[snake.py](#)” program by opening that file and clicking the “run” button in the top right corner. If everything works, you'll see a little snake game pop up!

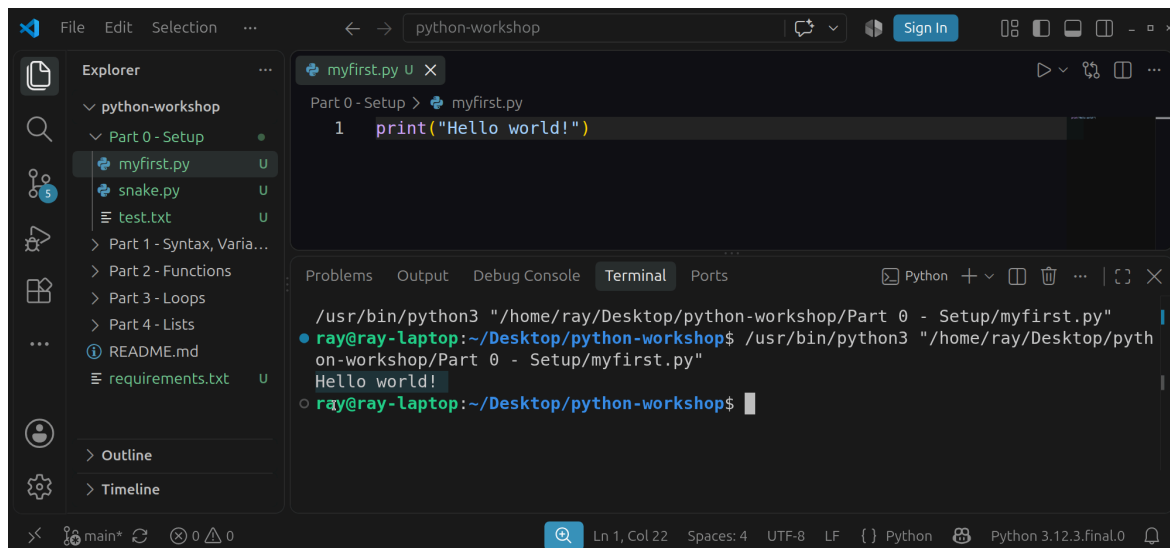

The run button will always run the file you are currently viewing.

## Creating and running your first program

Create a new python file in the folder “Part 0 - Setup” by right-clicking on that folder and selecting “New File”. Call it “[myfirst.py](#)”. You must include the file extension “.py” in the name.

Type the following code and run it with the run button. The terminal should automatically pop up and print the text “Hello world!”

A few things to note:

- The parenthesis are required
- The quotation marks are required
- The “p” in print must be lowercase
- “print” must be spelled exactly right

Code is very strict. VS Code will help you out by red-underlining errors.
